

Project Name: TravelWise

Team Members: Alexander Gutting, Victor Cao

Project Description:

The purpose of this application is to let the end user plan vacation. The user can add information for an upcoming vacation that the user has planned (e.g. number of days, location, date of arrival, date of departure, etc.).

User Persona

Victor Cao is a graduate student who enjoys traveling during breaks and holidays. He likes visiting new cities and often keeps his travel plans, hotel reservations, and activity lists in different places, making them difficult to manage. He wants a simple application where he can manage all of his vacation plans in one place and easily update them whenever his plans change.

Alexander Gutting is a graduate student at Northeastern University who enjoys traveling and has a trip to Italy planned at the end of the summer with some friends. However, Alexander has no definite plan on how he will make it work. He is unsure about what places to eat out at, what buildings/places to visit, and what hotel he and his friends will stay at.

User Stories

Victor Cao

1. As a user, I want to create a vacation plan so that I can organize my upcoming trips.
2. As a user, I want to edit and delete my vacation plans so that I can keep my travel info up to date.

Alexander Gutting

3. As a user, I want to have an easy way of planning every part of our trip so I am prepared in advance before my flight.
4. As a user, I want to add, edit, or delete any information that I may want changed in case of a potential change of plans.

Technical Design

Users Collection

- Stores user account information.
- Stores authentication credentials.

Technical Independence

Victor Cao will independently implement:

- Homepage and Trip Dashboard using React.
- Backend REST APIs for managing vacation plans.
- CRUD operations for the Trips collection.
- MongoDB integration using the native MongoDB driver.

Alexander Gutting will independently implement:

- User authentication using Passport.js.
- Login, Registration, and Profile pages using React.
- Assist with home screen/information cards
- Users collection and account management.
- Frontend integration with authentication APIs.

We collaborated using:

- VSCode (IDE)
- Figma (for mockups)
- Google Suite (for Design Document/Slideshow)
- Microsoft Teams (for communication)

Technology Stack

Frontend:

- React

Backend:

- Node.js
- Express

Database:

- MongoDB (Native Node.js Driver)

Data Requests:

- Fetch API

Formatting:

- Bootstrap
- Prettier

Direct Compatibility:

- ESLint
- JSON
